

# BaseRow No-Code Databases

In this video we're going to take a look at Baserow's no-code database solution and how to host it in Docker. Because Baserow is open source, we carefully considered everything what went into the technology stack. Under the hood of every docker container are two frameworks that made the cut: Django and Nuxt.js. Baserow is API first which means it is made to connect with other software.
